Colligative properties are properties that depend only upon the number of solute atoms, ions, or molecules in a solution and not on the nature of those atoms, ions or molecules. Freezing point depression and boiling point elevation are examples of colligative properties. Raoult discovered that the addition of solute particles causes the boiling point of a solution to be elevated and the freezing point to be depressed. It has been found that 1 mole of nonvolatile, nonionizing solute particles will raise the boiling point of 1.0 kg of water by 0.52 °C, to 100.52 °C at 1 atm of pressure. The same concentration will lower the freezing point of 1.0 kg of water by 1.86 °C, to -1.86 °C. These two numbers apply only to water and are called the molal boiling point and freezing point constants for water. Other solvents have different constants.

PROPERTY	BOILING POINT ELEVATION	FREEZING POINT DEPRESSION
	Boiling Point Elevation: A solution wil boil at a higher temperature than the pur solvent.	
	$\Delta T_b = i K_b m$	$\Delta T_f = i K_f m$
	ΔT_b = change in boiling temp. in (°C)	ΔT_f = change in freezing temp. in (°C)
EQUATION	i = a unitless constant (called the van't Hoff factor) associated with the degree of dissociation of the solute in a solvent.	i = a unitless constant (called the van't Hoff factor)associated with the degree of dissociation of the solute in a solvent.
	K _b = molal boiling point elevation constant (°C/m)	K_f = molal freezing point lowering constant (°C/m)
	For H ₂ O: $K_b = .52^{\circ}C/m$	For H ₂ O: K _f = 1.86°C/m
	m = molality of the solution	m = molality of the solution
GUIDLINES	i = 1 for substances that do not ionize 2 for substances which ionize into two ions like LiCl 3 for substances which ionize into three ions like CaCl ₂ etc. i may have to be calculated if a % of	i = 1 for substances that do not ionize 2 for substances which ionize into two ions like LiCl 3 for substances which ionize into three ions like CaCl ₂ etc. i may have to be calculated if a % of
	dissociation is given for a solute. If the solvent is not water you must find its K_b .	dissociation is given for a solute. If the solvent is not water you must find its K_f .

EXAMPLE #1

If 90.0 g of nonionizing C₆H₁₂O₆, are dissolved in 255 g of H₂O, what will be the boiling point of the resulting solution?

First calculate the molality (m) of the solution:

m =
$$\frac{92g}{(180 \frac{g}{\text{mole}})(0.255 \text{ kg of solvent})}$$
 = 2.0 m

Next apply the boiling point elevation equation:

[i = 1 for a nonionizing solute.]

$$\Delta T_b = i K_b m$$

 $\Delta T_b = (1)(0.52^{\circ}C/m)(2.0 m)$
 $\Delta T_b = 1.04^{\circ}C$
BP = $(\Delta T_b + 100.00^{\circ}C)$
BP = $(1.04^{\circ}C + 100.00^{\circ}C) = 101.04^{\circ}C$

EXAMPLE #2

If 152 g of sodium sulfate, Na₂SO₄, are dissolved in 875 g of H₂O, what will be the boiling point of the resulting solution? Assume 100% ionization.

First calculate the molality (m) of the solution:

$$m = \frac{152g}{(142 \frac{g}{\text{mole}})(0.875 \text{ kg of solvent})} = 1.22 \text{ m}$$

Next apply the freezing point depression equation:

$$\Delta T_f = i \; K_f \; m$$

$$i = 3 \; \text{since each unit of Na2SO4 yields 3 ions upon dissociation}.$$

$$\Delta T_f = (3)(1.86 \text{ °C/m})(1.22 \text{ m})$$

 $\Delta T_f = 6.8 \text{ °C}$
 $FP = 0.0 \text{ °C} - \Delta T_f$
 $FP = 0.0 \text{ °C} - 6.8 \text{ °C}$
 $FP = -6.8 \text{ °C}$

EXAMPLE #3

Determine the molality of a water solution if the boiling temperature is 104.42°C.

First solve the boiling point elevation equation for molality "m".

$$\begin{split} \Delta T_b &= i \; K_b m \\ m &= \frac{\prod T_b}{i \; K_b} \\ \Delta T_b &= 104.4 ^{\circ} \text{C} - 100 ^{\circ} \text{C} = 4.4 ^{\circ} \text{C}. \\ i &= 1 \; (\text{we can assume i is (1) for a problem of this type} \\ K_b &= 0.52 ^{\circ} \text{C/m} \end{split}$$

$$m &= \frac{4.4 ^{\circ} \text{C}}{(1) \; (0.52 \frac{^{\circ} \text{C}}{m})} = 8.46 \; \text{m}$$

Example #4

A solution of a nonelectrolyte contains 30 g of solute dissolved in 250 g of water. The boiling point of the water is observed to be 101.04°C. What is the GMM of this substance?

the molality of the solution can be calculated by using:

$$m = (\Delta T_b)/(i)(K_b) = (1.04^{\circ}C)/(1)(0.52^{\circ}C/m) = 2.0 \text{ m}$$

Then use this equation grams = (m)(GMM)(kg of solvent)

(Solve for GMM)
$$GMM = (grams)/(m)(kg of solvent) = (30 g)/(2 moles/kg)(0.250 kg) = 60g/mole$$

the freezing point is:

B. Calculate the molality of a water solution if

Practice Problems:

A. Calculate the molality, freezing point, and boiling point for each of the following water solutions of nonionizing solutes:

1. 144 g of C₆H₁₂O₆ dissolved in 1000 g of H₂O

7. -27.9°C

8. -7.44°C

6. -9.3°C

3. 184 g of C₂H₅OH dissolved in 400 g of H₂O

2. 48 g of CH3OH dissolved in 200 g of H2O

C. Calculate the molality of a water solution if the boiling point is:

9. 103.12°C

4. 600 g of C₃H₇OH dissolved in 600 g of H₂O

10. 108. 32°C

5. 100 g of of C2H6O2 dissolved in 200 g of H2O

D. Solve the following Problems

11. What is the boiling point of a solution made by dissolving 31 g of NaCl in 559 g of water? (Assume 100% ionization of NaCl.)

14. What is the molecular mass of a substance if 22.5 g dissolved in 250 g of water produces a solution whose freezing point is -0.930°C?

12. Calculate the freezing point of an a nonionizing antifreeze solution containing 388g ethylene glycol, C₂H₆O₂, and 409 g of water.

15 If 4.18 g of a nonionic solute is dissolved in 36.30 g of benzene, C6H6 , the freezing point is 2.70 °C. Find the molar mass of this solute. The freezing point of benzene is 5.53 °C and the K_f is 5.12 °C $/\mathrm{m}$.

13. Calculate the boiling point of an ionic solution containing 29.7 g Na₂SO₄ and 84.4 g water. (Assume 100% ionization.)
